

1st row: shower variables directly

2nd row: history with FJ variables

3rd row: final particles with FJ

- FastJet variables $(a \to b + c)$

$$z = \frac{p_{b_T}}{p_{c_T} + p_{b_T}},\ k_t = p_{b_t}\Delta_{cb},$$
$$m^2 = (p_b + b_c)^2$$

- m is well defined and Lorentz invariant in the first two rows, not in the 3rd (unambiguous history).
- z is not Lorentz invariant, results differences in the first two rows.
- k_t is not Lorentz invariant.
